

Junior Cybersecurity Analyst

This role specifically starts out as a one year apprenticeship that can eventually lead to a promotion in year two with the proper amount of training. It best suits me because it is for those who are highly motivated and eager to learn and grow while contributing to the overall success of the business. Their primary role is to defend an organization's computer networks and systems from cyber attacks or threats. They monitor security systems, analyze any potential alerts, and determine the best course of action needed in order to respond to security incidents. Maintaining security logs, investigating any types of unusual activity, and implementing security measures and controls is also another way of defining this particular role.

Responsibilities include-

- Being able to bridge the gap between technology, customers, and business operations internally.
- Working closely with multiple stakeholders that will provide customer service and account management through various types of business and IT processes.
- Help to develop solutions that will align with the overall goals of the company.
- Assist team members and work under their guidance and leadership so that first hand exposure is acquired.
- Providing the proper customer service to customers.
- Providing the right amount of account support for each and every business client as well as for key contacts.
- Providing the necessary project support in order to build team cooperation and chemistry.

Skills and tools-

It will be necessary for someone involved in this type of work to be proficient in scripting, intrusion detection, network security while also

being able to possess some soft skills such as communication, collaboration, and critical thinking.

Someone in this type of field could be responsible for creating a vulnerability assessment tool, a web application firewall, a network sniffing tool along with implementing a SIEM system, a home lab, an incident response plan, and a security report.

This job in particular seems to fall under the category of a startup, but it already has a wide variety of investors that support the organization, so perhaps because of that, it could be considered a large tech or even a nonprofit organization. The work style is more team oriented.

The actual work itself is most likely fast paced where you have to try and manage your time where you can get everything done in a timely manner, but it is very achievable as long as you work hard and take advantage of the mentorship portion of the job that is available. This leads to the fact that there could be some added pressure to have to perform well enough so that you can continue on with the specific path since it can lead to so much more afterwards in terms of promotions and raises for example.
